

One step ahead
Trend-setting technology for the
production of high-quality brick products

Dies *BASIC LINE*

The Basic line construction standard

In close cooperation between our sites in Friedrichshafen and Bad Salzuflen, the new Basic Line die generation was developed for the production of standard products such as intermediate wall bricks, compensation bricks and supplementary bricks.

The Basics are important because it can also be simpler and cheaper - without neglecting the quality of the products!

The Basic Line die is convincing by its optimum overall depth

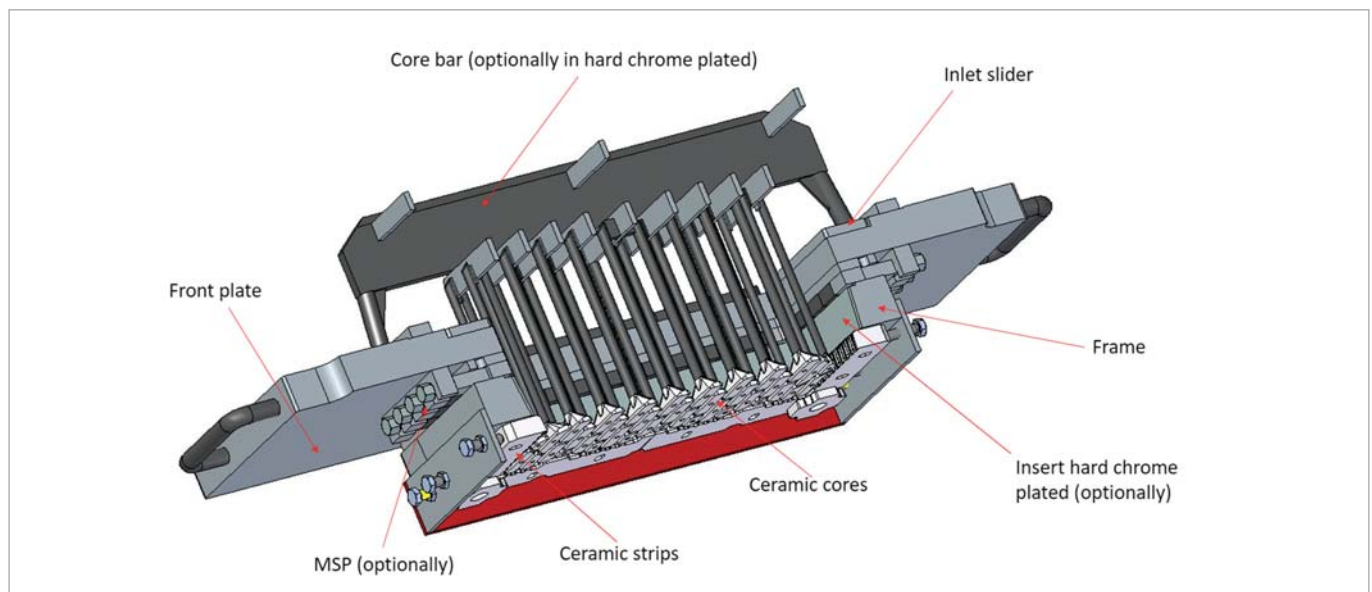

and flow geometry as well as the use of highly wear-resistant ceramics for shaping elements such as cores and outlet bars. These are adapted to the respective requirements and are the basis for the manufacture of high-quality standard products. Furthermore, the lower purchase costs, which are made possible by the simple design and the concentration on essential functions, are convincing.

The essential characteristics

- Optimum installation depth and flow geometry ensure the quality of your products
- Economical, very good price-performance ratio
- Excellent wear protection due to ceramic cores and ceramic strips

Options

- Hard chrome plating of the core bar
- Functional external regulation (MSP) to control the column drive.
- Hard chrome-plated protective insert as wear protection for the frame and the front plate

Due to a constant further development we reserve the right to make technical changes.
